Lists and Sequences

Outline and Reading

- Singly linked list
- Position ADT and List ADT (§ 2.2.2)
- Doubly linked list (§ 2.2.2)
- Sequence ADT (§ 2.2.3)
- Implementations of the sequence ADT (§ 2.2.3)
- Iterators (2.2.3)

Singly Linked List

- A singly linked list is a concrete data structure consisting of a sequence of nodes
- Each node stores
 - ▣ element
 - ▣ link to the next node

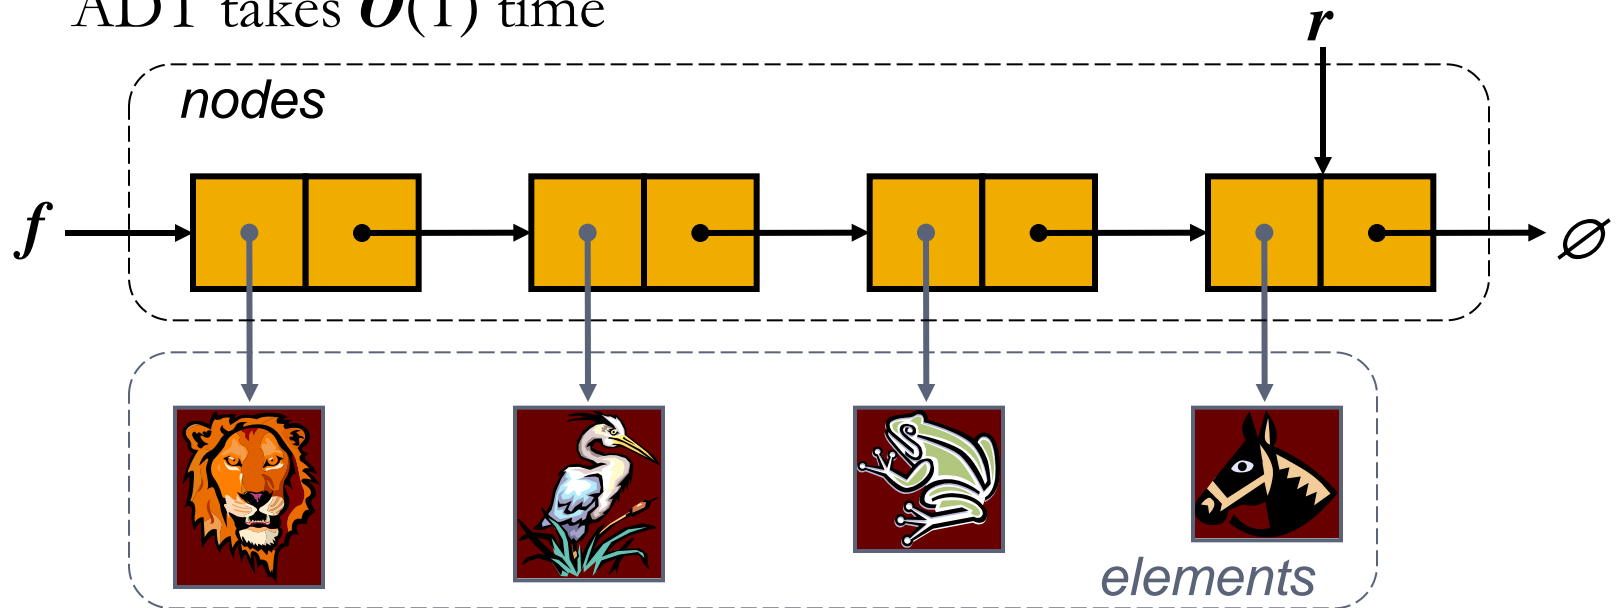

Stack with a Singly Linked List

- We can implement a stack with a singly linked list
- The top element is stored at the first node of the list
- The space used is $O(n)$ and each operation of the Stack ADT takes $O(1)$ time

Queue with a Singly Linked List

- We can implement a queue with a singly linked list
 - ▣ The front element is stored at the first node
 - ▣ The rear element is stored at the last node
- The space used is $O(n)$ and each operation of the Queue ADT takes $O(1)$ time

Position ADT

- The **Position** ADT models the notion of place within a data structure where a single object is stored
- It gives a unified view of diverse ways of storing data, such as
 - ▣ a cell of an array
 - ▣ a node of a linked list

List ADT

- The **List ADT** models a sequence of positions storing arbitrary objects
- It establishes a before/after relation between positions
- Generic methods:
 - ▣ `size()`, `isEmpty()`
- Query methods:
 - ▣ `isFirst(p)`, `isLast(p)`

Accessor methods:

- ▣ `first()`, `last()`
- ▣ `before(p)`, `after(p)`

Update methods:

- ▣ `replaceElement(p, o)`,
`swapElements(p, q)`
- ▣ `insertBefore(p, o)`,
`insertAfter(p, o)`,
- ▣ `insertFirst(o)`, `insertLast(o)`
- ▣ `remove(p)`

Doubly Linked List

- A doubly linked list provides a natural implementation of the List ADT
- Nodes implement Position and store:
 - ▣ element
 - ▣ link to the previous node
 - ▣ link to the next node
- Special trailer and header nodes

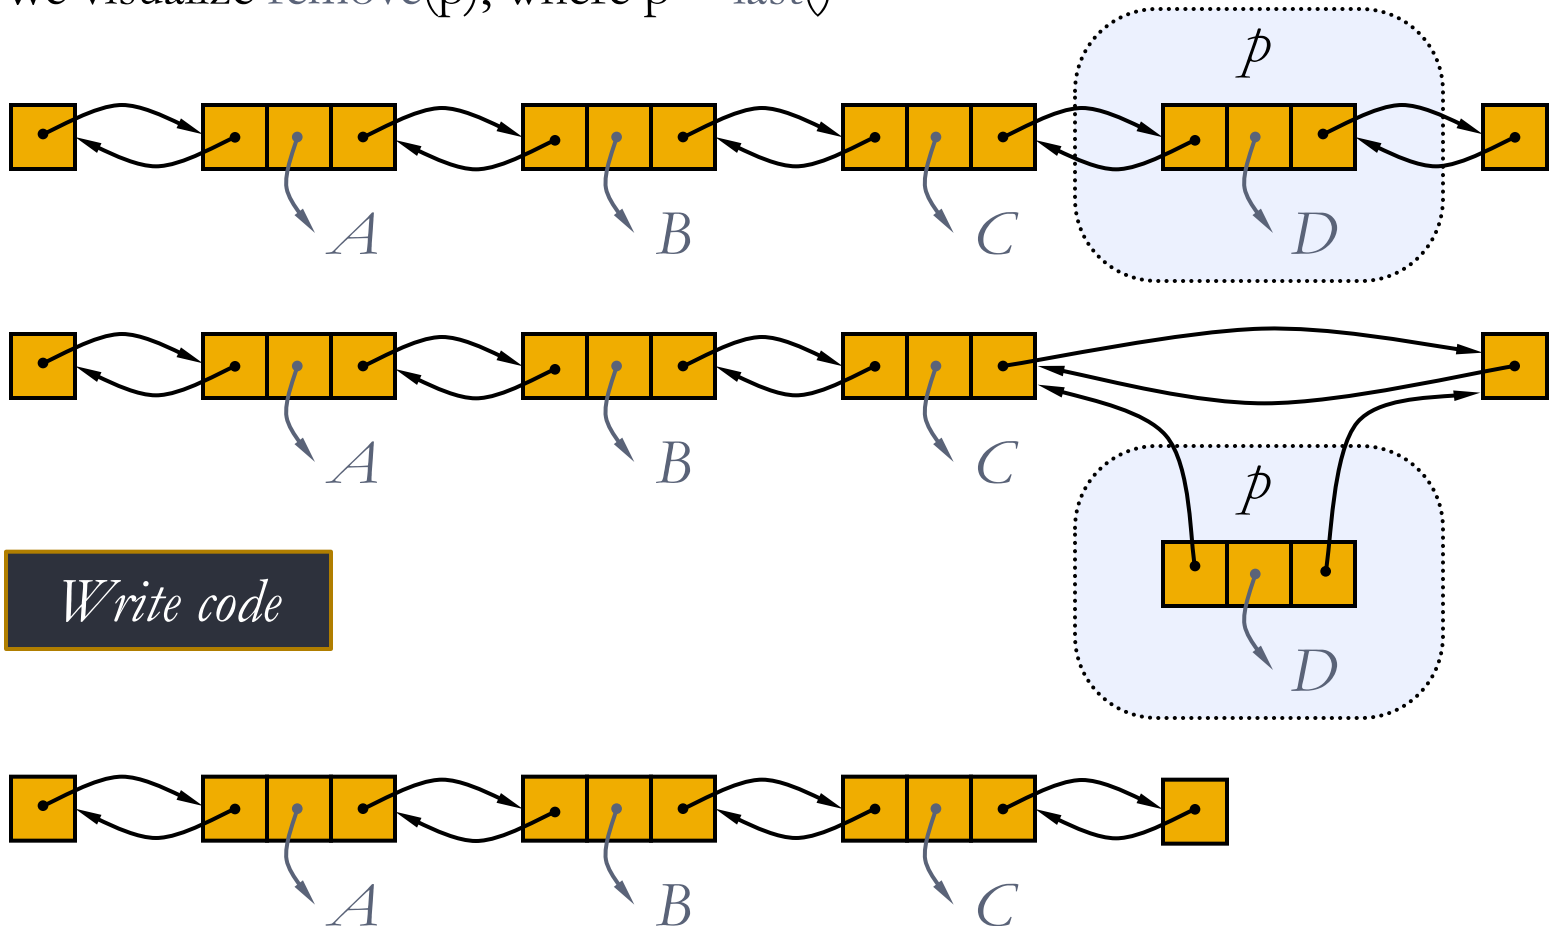

Insertion

- We visualize operation `insertAfter(p, X)`, which returns position q

Deletion

- We visualize `remove(p)`, where `p = last()`

Performance

- In the implementation of the List ADT by means of a doubly linked list
 - ▣ The space used by a list with n elements is $O(n)$
 - ▣ The space used by each position of the list is $O(1)$
 - ▣ All the operations of the List ADT run in $O(1)$ time
